

HOTEL ACCOUNTING ARCHITECTURE

We will divide the hotel's activities into departments:

- Accommodation
- Food and beverage
- Space rental

The various revenue sources by department are:

- Room night sales
- Food and beverage sales (breakfast, bar, restaurant...)
- Rental of the conference room, meeting rooms and other spaces

We have identified various direct operating expenses, namely:

- Energy costs (water, electricity, fuel)
- Raw material costs (purchase of food and beverages)
- Administrative costs (internet, office supplies, ink, taxes...)
- Operating supplies (cleaning products, soaps, guest kits, bed linen...)
- Direct staff costs (salaries, social security contributions)

We would like to obtain a computer system for:

- Presenting the different departments
- Tracking the occupancy of rooms, studios and apartments
- Tracking client account statements
- Recording revenue (receipts)
- Producing up to date, sequentially numbered cash receipts
- Recording cash flows arising, on the one hand, from collections from the restaurant, accommodation and other sources, and on the other hand, from disbursements related to the running of the business
- Producing the daily statement of collections and disbursements
- Producing an up to date dashboard showing revenue (receipts), expenses, profit margin, and the status of client and supplier accounts
- Recording accounting and financial transactions from a general accounting perspective on the one hand, and recording departmental expenses and income from a cost (analytical) accounting perspective on the other
